Selected Answer: Oropharyngeal Candida albicans infection • Question 50 1 out of 1 points A patient has been prescribed an oral drug that is known to have a high first-pass effect. Selected Answer: A 79-year-old male with cardiomegaly • Question 26 1 out of 1 points A 72-year-old man is prescribed theophylline for symptomatic relief of bronchial asthma. Selected Answer: "Prilosec will help your heartburn but it's not designed to provide immediate relief of specific episodes of heartburn." • Question 42 1 out of 1 points What critical piece of information is missing from the following medication order: Anoxicillin 250 mg every 8 hours? Selected Answer: A patient with a history of angina who experienced a non-ST wave myocardial infarction • Question 77 1 out of 1 points A clinic Nurse Practitioner is planning care for a 60-year-old man who has been on omeprazole (Prilosec) therapy for heartburn for some time. The nurse will advise him that he should experience therapeutic effects in Selected Answer: 15 to 30 minutes. Which of the following medications that the nurse will administer has the slowest absorption? The woman's subsequent hip-replacement surgery has been scheduled and the care team recognizes that the use of isoflurane will be most significantly influenced by Selected Answer: her history of emphysema. • Question 59 1 out of 1 points A 79-year-old woman with a medical history that includes osteoporosis has recently moved to a long-term care facility. The patient states, "I take it as soon as I feel heartburn coming on, but it doesn't seem to help at all." How should the nurse best respond to this patient's statement? Dextromethorphan is prescribed for him. The patient has a history of cardiovascular disease. Selected Answer: It is unlikely to influence the patient's other medications because gabapentin does not interact with other drugs. Selected Answer: Atorvastatin (Lipitor) • Question 11 1 out of 1 points A Nurse Practitioner is instructing a patient who was recently diagnosed with multiple sclerosis about dantrolene (Dantrium). The physician has recommended aspirin. How are these patient's characteristics likely to influence possible treatment with phenytoin? Consequently, the patient has been prescribed cholestyramine. Selected Answer: The amount of alcohol consumption • Question 48 1 out of 1 points A Nurse Practitioner who provides care in a long-term care facility is documenting a new resident's medication regimen on the resident's intake admission. • Question 3 1 out of 1 points The most effective therapy for a patient who is H. Which of the following should the nurse monitor to assess the efficacy of the lactulose therapy? The tribal chief has requested that the tribe's medicine man perform a ritual before the patient goes to surgery. As a result, he has been ordered the transdermal patch form of the medication. Regarding the patient's safety, which of the following would be a priority nursing action? When administering this form of rivastigmine, the nurse should Selected Answer: apply the patch to Mr. Lacuna's back to reduce the chance that he will remove it. Houston? The nurse will teach her to gradually decrease her dose of prednisone to avoid Selected Answer: adrenal insufficiency. Which of the following should the Nurse Practitioner assess before beginning drug therapy? What instructions should the NP provide about the timing and dose of regular insulin? Selected Answer: Short-acting and long acting inhaled beta2 agonists • Question 64 1 out of 1 points A patient in need of myocardial infarction prophylaxis has been prescribed sulfapyrazone for gout. The patient is concerned that the aspirin will upset her stomach. Selected Answer: Methimazole (Tapazole) is the drug of choice for pregnant or lactating females. Lactulose is prescribed. Verapamil achieves a therapeutic effect by Selected Answer: inhibiting the movement of calcium ions across the cardiac muscle cell membrane. Before he leaves the clinic he asks how long it will take for the medicine to work. Selected Answer: Carefully assess the patient for infections • Question 45 1 out of 1 points Mr. Tan is a 69-year-old man who prides himself in maintaining an active lifestyle and a healthy diet that includes adequate fluid intake. • Question 25 1 out of 1 points A normal maintenance dose for digoxin is 0.125 to 0.5 mg/day. The Nurse Practitioner notes that the resident takes allopurinol on a daily basis for the treatment of gout. • Question 58 1 out of 1 points A Nurse Practitioner is administering drugs to a 70-year-old patient who has a reduced plasma albumin level. • Question 70 1 out of 1 points To minimize the risk of adverse effects of glucagon when given to an unconscious diabetic patient, as the patient regains consciousness, the nurse should Selected Answer: administer carbohydrates. As a result, his physician has prescribed ranolazine (Ranexa). • Question 63 1 out of 1 points The APRN would use what class of medication to manage COPD? • Question 15 1 out of 1 points The Nurse Practitioner is conducting a medication reconciliation of a new resident of a long-term care facility. Selected Answer: The patient's protein deficit will likely increase the levels of the free drug in his blood. The nurse's response to this request should be Selected Answer: "As long as the ritual does not interfere with the patient's preoperative care, it will be okay." • Question 37 1 out of 1 points A patient has been prescribed rabeprazole (Aciphex). • Question 82 1 out of 1 points Which of the following statements best defines how a chemical becomes termed a drug? Selected Answer: Electrolyte levels • Question 8 1 out of 1 points Which of the following will a Nurse Practitioner inform the patient is one of the most common adverse effects of guaifenesin (Robitussin)? The emergency department physician orders intravenous nitroglycerin 5 mcg/min, titrate dose by 5 mcg/min every 3 to 5 minutes per infusion pump as needed. He is beginning to exhibit signs of decline in his renal system, yet his current serum creatinine level is normal. Which of the following medications is most likely to treat this boy's diagnosis? • Question 49 1 out of 1 points A female patient, age 36, is prescribed inhaled corticosteroid (ICS) for daily use. Before the drug therapy is started, the nurse will assess for which of the following? It will be important for the nurse to assess the patient's drug history to determine if the patient is taking which of the following drugs? The best choice of medication to treat this patient is: Selected Answer: 3. Houston is a 78-year-old woman who resides in an assisted living facility. Loratadine (Claritin) is prescribed. The nurse's teaching plan will include a basic explanation of how the drug produces its therapeutic effect. The boy has also experienced intermittent abdominal pain and has lost almost 15 pounds this year. Selected Answer: The man's chest sounds are clear and his ankle edema is lessened. He will be taking 20 units of lantus at bedtime and regular insulin before meals. The man also wears dentures, which makes it even more difficult for him to swallow medication. Which of the following adverse effects should the nurse closely monitor for in this patient? The patient is on the maximum dose of metformin and glucotrol. Selected Answer: Potassium levels • Question 41 1 out of 1 points A 60-year-old man has scheduled a follow-up appointment with his primary care provider stating that the omeprazole (Prilosec) which he was recently prescribed is ineffective. • Question 24 1 out of 1 points A 70-year-old man with diabetes mellitus is taking metoprolol (Lopressor) to manage his hypertension. • Question 2 1 out of 1 points Mr. Nguyen, age 71, will be discharged to the hospital after a successful coronary artery bypass graft (CABG). Selected Answer: How well a drug produces its desired effect. • Question 90 1 out of 1 points A 29-year-old female patient has been prescribed orlistat (Xenical) for morbid obesity. Recently, the woman fell outside her home as a result of weakness and suffered a fracture to her femoral head. • Question 80 1 out of 1 points A 70-year-old woman has a complex medical and a current drug regimen that includes calcium and vitamin D supplements for osteoporosis, metformin (Glucophage) for type 2 diabetes, phenolazine (Nardil) for depression, and metoprolol (Lopressor) and furosemide (Lasix) for hypertension. Selected Answer: Mesalamine • Question 61 1 out of 1 points A Nurse Practitioner is instructing a patient concerning a newly prescribed drug. It will be a priority for the Nurse Practitioner to monitor for Selected Answer: ototoxicity. Selected Answer: Hair loss • Question 57 1 out of 1 points Which statement is FALSE regarding the treatment of hyperthyroidism? Which of the patient's medications should prompt the nurse to teach her to avoid drinking grapefruit juice? In which of the following patients would the nurse most likely administer a lower-than-normal maintenance dose of digoxin? Selected Answer: Bleeding • Question 65 1 out of 1 points A Nurse Practitioner receives an order to administer a critically ill patient two drugs immediately (stat). Selected Answer: The woman will be more susceptible to hypotension than a younger patient. The patient has asked the Nurse Practitioner if there are any "bad side effects" that she should be aware of. Selected Answer: Take 1 unit of regular insulin for each 10 grams of carbohydrate to be consumed 15 minutes before each meal • Question 95 1 out of 1 points You are seeing a 55 year old patient recently diagnosed with a bleeding ulcer. In order to minimize one important adverse effect of the drug, the nurse will give the patient which of the following instructions? Selected Answer: Yes The nurse will explain that lovastatin lowers cholesterol levels because it Selected Answer: inhibits cholesterol syntheses. Treatment of high cholesterol using statins would be contraindicated in which of the following patients? • Question 66 1 out of 1 points Following an assessment by her primary care provider, a 70-year-old resident of an assisted living facility has begun taking daily oral doses of levothyroxine. • Question 34 1 out of 1 points A patient has been prescribed a drug that can be self-administered at home. What drug should the nurse suggest the parents to use in these situations? Selected Answer: A chemical must have a proven therapeutic value or efficacy without severe toxicity or damaging properties to become a drug. • Question 69 1 out of 1 points Mr. Lacuna is an 83-year-old resident of a long-term care facility who has a diagnosis of moderate Alzheimer disease. • Question 73 1 out of 1 points A male patient is to begin treatment for pneumonia with an albuterol (Ventolin) inhaler. Which of the following lab values would be a priority for the nurse to assess before administration? The nurse will discuss with the patient the possibility for which of the following adverse effects related to the new drug therapy? However, Mr. Tan states that he has experienced occasional constipation in recent months. Which of the following measures has the potential to increase the amount of the free drug that is available to body cells? • Question 60 1 out of 1 points A teenage boy has undergone a diagnostic workup following several months of persistent, bloody diarrhea that appears to lack an infectious etiology. Selected Answer: Give 19 units of Lantus subcutaneously prior to bedtime. • Question 83 1 out of 1 points It is determined that a patient, who is in a hepatic coma, needs a laxative. Current weight 212 pounds. Selected Answer: Coordinate bone density testing for the patient. Levothyroxine (Synthroid) has been prescribed. (Select all that apply.) Selected Answers: Heart rate Blood pressure • Question 75 1 out of 1 points A female patient with a diagnosis of type 1 diabetes mellitus has been experiencing increasing neuropathic pain in recent months, a symptom that has not responded appreciably to conventional analgesics. The man is known to be a heavy alcohol user and is malnourished with a very low body mass index. Selected Answer: Take it on an empty stomach, 1 hour before or 2 hours after meals • Question 21 1 out of 1 points A Nurse Practitioner is caring for a 78-year-old patient with renal insufficiency and chronic heart failure who is receiving rapid infusions of high-dose furosemide. The nurse will instruct him to Selected Answer: open the capsule and sprinkle the beads in applesauce. The nurse will encourage the patient to Selected Answer: swallow the tablet with milk or food. • Question 6 0 out of 1 points The APRN is treating a 56 year old male with diagnosed atrial fibrillation. • Question 13 1 out of 1 points A Nurse Practitioner is caring for a patient who is diabetic and has been diagnosed with hypertension. What is the primary purpose of this drug? Selected Answer: Digoxin immune fab • Question 29 1 out of 1 points A patient is admitted to the emergency department with severe chest pain. • Question 94 1 out of 1 points A 22 year old patient is transitioning from oral agents to insulin. Labs from this morning indicate a fasting blood sugar of 312 and HbA1C of 9. • Question 47 1 out of 1 points A 24-year-old factory worker has been prescribed guaifenesin for the first time. Selected Answer: It can be combined with an inhaled corticosteroid to improve asthma control • Question 10 1 out of 1 points A patient with a variety of chronic health problems is being seen by her nurse practitioner, who is currently reviewing the patient's medication regimen. Her care provider has recently added spironolactone (Aldactone) to the woman's medication regimen. Bradycardia is present, and an electrocardiogram (ECG) confirms toxicity. The patient is a 38-year-old-male and the foreman for a construction company. Selected Answer: Throat irritation • Question 74 1 out of 1 points A 77-year-old patient has a long-standing history of hypertension, a health problem that is being treated with metoprolol and a thiazide diuretic. The nurse should consequently assess for signs and symptoms of Selected Answer: hyperkalemia. Before administering the 8 AM dose of these medications, what assessments should the nurse perform and document? Her doctor prescribed digoxin at her last visit to the clinic and she has approached the nurse who makes regular visits to the assisted-living facility about this new drug. The nurse will administer which of the following drugs? Selected Answer: An obese male client who is a heavy alcohol user and who has cirrhosis of the liver • Question 93 1 out of 1 points A Nurse Practitioner is caring for a 73-year-old man who is receiving drug therapy. Selected Answer: Most patients tolerate statins well, with minor muscle aches being among the most common adverse effects. The Nurse Practitioner is documenting the generic, rather than proprietary, names of the resident's current drugs because Selected Answer: there is a potential for confusion and miscommunication if proprietary names are used. He states that he has to have relief, that he has been coughing every 2 to 3 minutes, and he is worn out. What dose and instructions should the APRN provide? Selected Answer: Triglyceride levels • Question 97 1 out of 1 points A patient is bothered with nighttime episodes of bronchoconstriction related to asthma. The nurse's assessment reveals that the patient has been taking over-the-counter laxatives for the past 7 years. The nurse understands that white Americans usually receive Selected Answer: a higher-than-normal dose of drugs that bind to acid glycoproteins. Beta blocker • Question 28 1 out of 1 points A 58-year-old man is admitted to the emergency department. Selected Answer: Enlarged prostate gland • Question 27 1 out of 1 points A patient with unstable angina pectoris who is NOT controlled with a nitrate would likely benefit most from the addition of: Selected Answer: 2. Which of the following findings would alert the nurse to the need for close monitoring? Selected Answer: Coffee • Question 19 1 out of 1 points A patient has been prescribed lovastatin for a high cholesterol level. Selected Answer: A Proton Pump Inhibitor • Question 96 1 out of 1 points A 79-year-old patient in a long-term care facility is to receive an intravenous fat emulsion. A diagnosis of severe digoxin toxicity is made. • Question 54 1 out of 1 points The APRN should educate a diabetic patient that beta blockers may mask the signs and symptoms of Selected Answer: hypoglycemia • Question 55 1 out of 1 points A Nurse Practitioner is providing patient education to a 35-year-old man who has been prescribed clonidine (Catapres) as part of step 2 antihypertensive therapy. An important instruction to the patient would be to Selected Answer: omit the dose if the meal does not contain fat. Selected Answer: Phenelzine (Nardil) • Question 81 1 out of 1 points A 68-year-old man complains of a chronic, nonproductive cough. Selected Answer: Wear appropriate clothing and sunscreen whenever he is in direct sunlight • Question 12 1 out of 1 points A 66-year-old woman has a complex medical history that includes poorly-controlled type 1 diabetes, renal failure as a result of diabetic nephropathy and chronic heart failure (CHF). The nurse will prioritize the assessment of which of the following? He is in the clinic to talk to the nurse about his problem. Selected Answer: Digoxin • Question 38 1 out of 1 points A 46-year-old white American has been prescribed a drug that binds to acid glycoproteins. • Question 71 1 out of 1 points A 47-year-old woman has been diagnosed with open-angle glaucoma. The nurse would be sure to instruct the patient to Selected Answer: understand the signs and symptoms of hypoglycemia. What teaching point should the nurse emphasize to Mrs. Which of the following will the nurse monitor the patient most closely for? Selected Answer: "Yes, but be sure to wait at least 2 hours to take the antacid after you take the ranitidine." • Question 40 1 out of 1 points A Nurse Practitioner is caring for a patient who is taking digoxin and a loop diuretic. Selected Answer: Route • Question 43 1 out of 1 points A male patient is to begin glyburide (Diabeta) for type 2 diabetes. How is the addition of this drug likely to influence the management of the patient's existing drug regimen? • Question 99 0 out of 1 points A 62 year old male who had a myocardial infarction one year ago is being seen for hypertension. The APRN wants to start the patient on Lantus 0.2 unit/kg. She continues to have gastric discomfort and asks whether she can take an antacid. What remedy should be the nurse's first suggestion? Selected Answer: Using the two drugs to treat a health problem may create a synergistic effect. • Question 23 1 out of 1 points A homeless man who is well known to care providers at the local hospital has been admitted to the emergency department after having a seizure outside a mall. The prescribed drug is supposed to decrease cardiac output. During patient education about his drug regimen, Mr. Nguyen's nurse should prioritize teach about Selected Answer: potential adverse effects of the drugs that Mr. Nguyen will be taking. The nurse will advise the patient that he will most likely experience which of the following common adverse effects of the drug? NURS 6521C Advanced Pharmacology Midterm Sample 3 (Study Guide) • Question 1 1 out of 1 points A Nurse Practitioner explains to a patient that nitroglycerin patches should be applied in the morning and removed in the evening. Selected Answer: Measures to alleviate any discomfort associated with adverse effects • Question 62 1 out of 1 points A 45-year-old man who is a construction worker has been diagnosed with hyperlipidemia and has been prescribed lovastatin. • Question 39 1 out of 1 points A patient has GERD and is taking ranitidine (Zantac). • Question 17 1 out of 1 points A patient has been prescribed a Scheduled 5 drug, an example of this drug is Selected Answer: Antitussives • Question 18 1 out of 1 points A Nurse Practitioner is providing discharge planning for a 45-year-old woman who has a prescription for oral albuterol. The woman is requesting dextromethorphan for the treatment of a recurrent cough. Selected Answer: Gastrointestinal distress • Question 9 1 out of 1 points Which of the following is TRUE about long acting beta agonist use in asthma patients? • Question 20 1 out of 1 points A patient with bronchial asthma is prescribed a sustained-release preparation of theophylline. His vital signs are BP 100/68 HR 144 RR 22. Selected Answer: The therapeutic effects and possible adverse effects • Question 35 1 out of 1 points The APRN is treating a patient with type 2 diabetes. Selected Answer: An oral antidiabetic that the patient has been taking daily for several years • Question 31 1 out of 1 points The lower respiratory system utilizes a number of different mechanisms that confer protection and maintain homeostasis. Selected Answer: The resident's apical heart rate is 112 beats/minute with a regular rhythm • Question 67 1 out of 1 points To maximize the therapeutic effect of diphenoxylate HCl with atropine sulfate, the nurse will instruct the patient to take the medication Selected Answer: four times a day. The nurse will advise the patient to Selected Answer: avoid prolonged exposure to sunlight. Which of the following statements will the nurse include when providing patient education concerning this drug? The Nurse Practitioner will question the patient about her intake of which of the following? Which of the following assessment findings would suggest that the loop diuretic is contributing to a therapeutic effect? The nurse's assessment reveals that the patient has worn soft contact lenses for 15 years. • Question 56 1 out of 1 points Mesalamine (Asacol) is prescribed for a 22-year-old woman with Crohn disease. Selected Answer: Leukotriene modifiers • Question 98 1 out of 1 points A 49-year-old woman has been diagnosed with myalgia. • Question 86 1 out of 1 points A patient is in the clinic for seasonal allergic rhinitis. Which of the following will be a priority assessment by the nurse before the patient's first dose? • Question 32 1 out of 1 points A Nurse Practitioner has administered a medication to a patient with hypertension. • Question 78 1 out of 1 points Mrs. The nurse should assess which of the following? Before the drug therapy begins, a priority action by the nurse will be to assess the patient's Selected Answer: use of alcohol. Which of the following would be most important for the Nurse Practitioner to monitor? The Nurse Practitioner will base the patient's plan of care on the understanding that there is Selected Answer: a decrease in the amount of creatinine to be filtered. • Question 101 0 out of 0 points When completing this exam, did you comply with Walden University's Code of Conduct including the expectations for academic integrity? The nurse informed the patient that prolonged use of laxatives Selected Answer: may cause nutrient deficiencies. • Question 33 1 out of 1 points A 76-year-old woman has a complex medical history that includes emphysema, osteoporosis, malnutrition, and hypothyroidism. What is the most likely rationale for using two medications to address the patient's hypertension? Which of the following assessment findings should prompt the nurse to withhold a scheduled dose of levothyroxine? • Question 68 1 out of 1 points The Nurse Practitioner is performing patient education for a woman who will soon begin treatment of hyperlipidemia with simvastatin (Zocor). Selected Answer: Cilia sweep foreign material and mucus upward toward the trachea and larynx where they can then be swallowed. Which of the following medications can be administered to decrease the nighttime episodes and prevent asthma attacks? He is currently having problems with not being able to swallow large tablets or capsules. • Question 36 1 out of 1 points A Native American man who lives a traditional lifestyle is scheduled to have heart surgery. • Question 72 1 out of 1 points Several months of treatment with a statin accompanied by lifestyle modifications have failed to appreciably improve a patient's cholesterol levels. The nurse should recognize that this drug achieves its therapeutic effect by Selected Answer: oxidizing cholesterol to bile acids. Which medication has the best evidence in mortality reduction? He is complaining of being light headed. Which of the following statements should underlie the nurse's response? • Question 91 1 out of 1 points Advanced practice nurse prescribing of scheduled medications is affected most by: Selected Answer: Individual states laws regarding scheduled medications that can be prescribed and for how long • Question 92 1 out of 1 points A Nurse Practitioner who provides care in a busy clinic is aware of the high incidence and prevalence of hyperlipidemia and the consequent need for antihyperlipidemics in many patients. Selected Answer: Mr. Penny requires concurrent treatment with a beta blocker, nitrate, or a calcium channel blocker. This patient's age will have what effect on her use of nitroglycerin? Which of the following actions should the Nurse Practitioner take in order to minimize the potential for adverse drug effects and risks associated with prednisone treatment? Selected Answer: The importance of having required laboratory work performed on time • Question 79 1 out of 1 points In light of her recent high blood pressure readings, a patient has been started on a thiazide diuretic and metoprolol (Lopressor), which is a beta-adrenergic blocker. What should be the initial treatment choice for this patient? pylori positive with a gastric ulcer is: Selected Answer: Bismuth, Metronidazole, Omeprazole, and Tetracycline • Question 4 1 out of 1 points A 60-year-old African-American man lives with a number of chronic health problems. The most likely initial drug therapy for this patient will be Selected Answer: a diuretic. The Nurse Practitioner should anticipate that the drug will be administered Selected Answer: transdermally. Selected Answer: Serum potassium levels • Question 14 1 out of 1 points During a clinic visit, a patient complains of having frequent muscle cramps in her legs. Selected Answer: A bulk-forming (fiber) laxative • Question 46 1 out of 1 points Frequent episodes of exercise-related chest pain have caused a 79-year-old woman to use her prescribed nitroglycerin spray several times in recent weeks. Medication reconciliation indicates that the woman has been taking calcitonin, salmon for several years. Selected Answer: Administering the drug intravenously rather than orally • Question 51 1 out of 1 points Mr. Penny, age 67, was diagnosed with chronic angina several months ago and has been unable to experience adequate relief of his symptoms. • Question 89 1 out of 1 points A Nurse Practitioner is discussing with a patient the efficacy of a drug that his physician has suggested, and he begin taking. The nurse will instruct the patient to Selected Answer: remove the contact lenses before applying the drops. Which of the following would be the most important information for the nurse to relate to the patient concerning self-administration of a drug? For which of the following patients would nicotine gum be contraindicated? Sneezes are a result of Selected Answer: a CNS reflex that is initiated by receptors in the nasal cavities. Pilocarpine drops are prescribed. A decrease in cardiac output would most likely Selected Answer: decrease the amount of circulating blood sent through the kidneys. To help minimize the adverse effects of the drug, which of the following should the nurse suggest? The nurse should recognize that the most likely route for the administration of this drug is Selected Answer: intranasal. The nurse is currently teaching the parent's about the appropriate use of a "rescue drug" for acute exacerbations of their son's asthma. Selected Answer: Blood pressure • Question 30 1 out of 1 points An elderly postsurgical patient has developed postoperative pneumonia in the days following abdominal surgery and is being treated with a number of medications. Selected Answer: Blood ammonia levels • Question 84 1 out of 1 points The parents of a 7-year-old boy who has just been diagnosed with allergic asthma are being taught about their son's medication regimen by the nurse. This medication schedule reduces the potential for Selected Answer: nitrate tolerance. Cardiac glycoside such as Digoxin • Question 7 1 out of 1 points A Nurse Practitioner is caring for a 70-year-old patient who is taking desmopressin (DDAVP). Before administering the nitroglycerin, the nurse should prioritize which of the following assessments? • Question 22 1 out of 1 points A 39-year-old African-American male is 25 pounds overweight and has been diagnosed with hypertension after three consecutive above-normal blood pressure readings. An angiotensin-converting enzyme inhibitor, captopril, has been prescribed for her. • Question 52 1 out of 1 points A Nurse Practitioner is caring for a patient who has been diagnosed with hypothyroidism. What component of her drug regimen contraindicates the use of dextromethorphan? The patient's care provider has begun treatment with gabapentin (Neurontin). Which of the following statements is true regarding the use of ranolazine for the treatment of this patient's angina? Selected Answer: To balance urate concentration and prevent gout attacks • Question 16 1 out of 1 points A woman has a long history of seasonal allergies that are typically accompanied by rhinorrhea, red eyes, and frequent sneezing. Selected Answer: Serum phosphate level • Question 88 1 out of 1 points A 77-year-old man's chronic heart failure is being treated with a regimen of quinapril (Accupril) and furosemide (Lasix). Efficacy of a drug means which of the following? • Question 5 1 out of 1 points A female patient has been taking prednisone for her asthma for 1 month. • Question 44 1 out of 1 points A Nurse Practitioner is overseeing the care of a young man whose ulcerative colitis is being treated with oral prednisone. Mr. Lacuna's physician recently prescribed oral rivastigmine, but he was unable to tolerate the drug due to its gastrointestinal effects. The Nurse Practitioner begins the process by Selected Answer: consulting a drug guide for compatibility. Which of the following physiological processes protects the lower respiratory system? Selected Answer: History of taking anticoagulant drugs • Question 53 1 out of 1 points A 72-year-old man is taking Adderall XR for the treatment of narcolepsy. Selected Answer: "Determine if the drug is going to make you drowsy before you drive." • Question 87 1 out of 1 points A patient who takes aluminum hydroxide with magnesium hydroxide (Mylanta) frequently for upset stomach, heartburn, and sour stomach is seen regularly in the clinic. Genetic factors are likely to influence his etiology and/or treatment of Selected Answer: hypertension. • Question 76 1 out of 1 points A Nurse Practitioner who provides care on an acute medicine unit has frequently recommended the use of nicotine replacement gum for patients who express a willingness to quit smoking during their admission or following their discharge. Selected Answer: Beta blocker • Question 100 1 out of 1 points A 70-year-old woman with a history of atrial fibrillation takes digoxin and verapamil to control her health problem. When assessing the patient for therapeutic outcomes of drug therapy, the Nurse Practitioner will also be careful to observe for Selected Answer: possible drug toxicity. The nurse is providing patient education concerning the drug. Which of the following is an appropriate response by the nurse? Which of the following should be included to help improve patient compliance and safety? Selected Answer: Albuterol • Question 85 1 out of 1 points An expected outcome for a patient who has just taken sublingual nitroglycerin should be Selected Answer: increased heart rate and decreased blood pressure.
